#### Overview

- Combining multiple learners
- Voting
- Bagging
- Boosting
- AdaBoost

#### Reference

## Multiple learners / Ensemble learning

General idea: instead of training a complex learner/model, train many different learners/models and then combine their results.

Committees: set of models trained on a dataset.

Models can be trained in parallel (voting or bagging) or in sequence (boosting).

Luca locchi 13. Multiple learners 4 / 20

### Voting

Given a dataset D

- 1. use D to train a set of models  $y_m(\mathbf{x})$ , for  $m=1,\ldots,M$
- 2. make predictions with

$$y_{voting}(\mathbf{x}) = \sum_{m=1}^{M} w_m y_m(\mathbf{x})$$
 (regression)

$$y_{voting}(\mathbf{x}) = \operatorname*{argmax}_{c} \sum_{m=1}^{M} w_m I(y_m(\mathbf{x}) = c)$$
 weighted majority (classification)

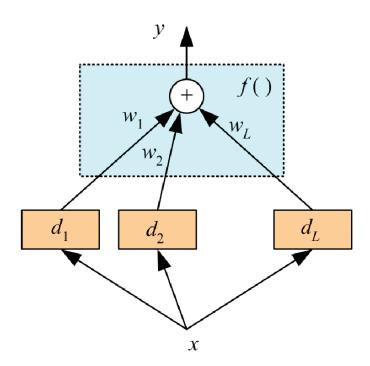

with  $w_m \ge 0$ ,  $\sum_m w_m = 1$  (prior probability of each model), I(e) = 1 if e is true, 0 otherwise.

## Bagging

Given a dataset D,

- 1. generate M bootstrap data sets  $D_1, \ldots, D_M$ , with  $D_i \subset D$
- 2. use each bootstrap data set  $D_m$  to train a model  $y_m(\mathbf{x})$ , for m = 1, ..., M
- 3. make predictions with a voting scheme

$$y_{bagging}(\mathbf{x}) = \frac{1}{M} \sum_{m=1}^{M} y_m(\mathbf{x})$$

In general, this is better than training any individual model.

Bootstrap data sets chosen with random sampling with replacement

Luca locchi 13. Multiple learners 10 / 20

## Boosting: general approach

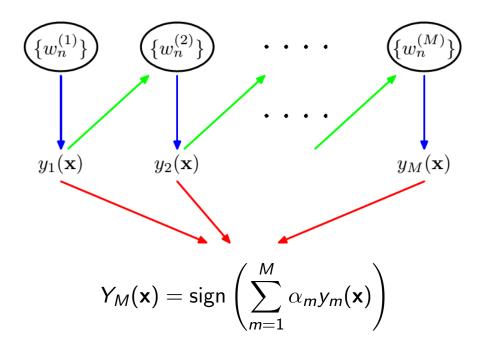

#### Main points:

- Base classifiers (weak learners) trained sequentially
- Each classifier trained on weighted data
- Weights depend on performance of previous classifiers
- Points misclassified by previous classifiers are given greater weight
- Predictions based on weighted majority of votes

Luca locchi 13. Multiple learners 11 / 20
Sapienza University of Rome, Italy - Machine Learning (2021/2022)

### Boosting: general approach

Base classifiers are trained in sequence using a weighted data set where weights are based on performance of previous classifiers.

Luca locchi 13. Multiple learners 12 / 20

#### AdaBoost

Given  $D = \{(\mathbf{x}_1, t_1), \dots, (\mathbf{x}_N, t_N)\}$ , where  $\mathbf{x}_n \in \mathbf{X}$ ,  $t_n \in \{-1, +1\}$ 

- 1. Initialize  $w_n^{(1)} = 1/N$ , n = 1, ..., N.
- 2. For m = 1, ..., M:
  - Train a weak learner  $y_m(\mathbf{x})$  by minimizing the weighted error function:

$$J_m = \sum_{n=1}^N w_n^{(m)} I(y_m(\mathbf{x}_n) \neq t_n)$$
, with  $I(e) = \begin{cases} 1 & \text{if } e \text{ is true} \\ 0 & \text{otherwise} \end{cases}$ 

- Evaluate:  $\epsilon_m = \frac{\sum_{n=1}^N w_n^{(m)} I(y_m(\mathbf{x}_n) \neq t_n)}{\sum_{n=1}^N w_n^{(m)}}$  and  $\alpha_m = \ln \left[ \frac{1 \epsilon_m}{\epsilon_m} \right]$
- Update the data weighting coefficients:

$$w_n^{(m+1)} = w_n^{(m)} \exp[\alpha_m I(y_m(\mathbf{x}_n) \neq t_n)]$$

## Exponential error minimization

AdaBoost can be explained as the sequential minimization of an exponential error function.

Consider the error function

$$E = \sum_{n=1}^{N} \exp[-t_n f_M(\mathbf{x}_n)],$$

where

$$f_M(\mathbf{x}) = \frac{1}{2} \sum_{m=1}^{M} \alpha_m y_m(\mathbf{x}), \quad t_n \in \{-1, +1\}$$

Goal:

minimize E w.r.t.  $\alpha_m, y_m(\mathbf{x}), m = 1, \dots, M$ 

Luca locchi 13. Multiple learners 16 / 20

### Exponential error minimization

**Sequential minimization.** Instead of minimizing E globally

- assume  $y_1(\mathbf{x}), \dots, y_{M-1}(\mathbf{x})$  and  $\alpha_1, \dots, \alpha_{M-1}$  fixed;
- minimize w.r.t.  $y_M(\mathbf{x})$  and  $\alpha_M$ .

Making  $y_M(\mathbf{x})$  and  $\alpha_M$  explicit we have:

$$E = \sum_{n=1}^{N} \exp \left[ -t_n f_{M-1}(\mathbf{x}_n) - \frac{1}{2} t_n \alpha_M y_M(\mathbf{x}_n) \right]$$
$$= \sum_{n=1}^{N} w_n^{(M)} \exp \left[ -\frac{1}{2} t_n \alpha_M y_M(\mathbf{x}_n) \right],$$

with  $w_n^{(M)} = \exp[-t_n f_{M-1}(\mathbf{x}_n)]$  constant as we are optimizing w.r.t.  $\alpha_M$  and  $y_M(\mathbf{x})$ .

Luca locchi

13. Multiple learners

17 / 20

Sapienza University of Rome, Italy - Machine Learning (2021/2022)

## Exponential error minimization

From sequential minimization of E, we obtain

$$w_n^{(m+1)} = w_n^{(m)} \exp[\alpha_m I(y_m(\mathbf{x}_n) \neq t_n)] \text{ and } \alpha_m = \ln\left[\frac{1 - \epsilon_m}{\epsilon_m}\right]$$

predictions are made with

$$sign(f_M(\mathbf{x})) = sign\left(\frac{1}{2}\sum_{m=1}^{M} \alpha_m y_m(\mathbf{x})\right)$$

which is equivalent to

$$Y_M(\mathbf{x}) = \operatorname{sign}\left(\sum_{m=1}^M \alpha_m y_m(\mathbf{x})\right)$$

thus proving that AdaBoost minimizes such error function.

Luca locchi 13. Multiple learners 18 / 20

### AdaBoost Remarks

#### Advantages:

- fast, simple and easy to program
- no prior knowledge about base learner is required
- no parameters to tune (except for M)
- can be combined with any method for finding base learners
- theoretical guarantees given sufficient data and base learners with moderate accuracy

#### Issues:

- Performance depends on data and the base learners
   (can fail with insufficient data or when base learners are too weak)
- Sensitive to noise

Luca locchi 13. Multiple learners 19 / 20
Sapienza University of Rome, Italy - Machine Learning (2021/2022)

## Summary

- Instead of designing a learning algorithm that is accurate over the entire space one can focus on finding base learning algorithms that only need to be better than random
- Combined learners theoretically outperforms any individual learner
- AdaBoost practically outperforms many other base learners in many problems
- Ensembles of small DNN outperform very deep NN in some cases
